His contribution is remarkable because it is an incredible combination of all the earlier works on the same subject. The author reminds the reader about the theory of the aeolian (wind) wind and sand transport from the Himalaya Mountain range which was first put forward by C.B. Abbott in 1922. It was popularized in the 1960s by G.W. Berry Jr. who published the first monograph on this subject. This theory was later developed by R.A. Sijbens in the early 1970s. Thus the theory of sand transport by the wind was first put forward during the nineteenth century. The author recalls the work of D. T. Wilson who studied and described the surface geology of the Kashmir Himalaya during the 1930s. He put forward the hypothesis of river-like channeled landforms at the end of the Pleistocene or Holocene. He provided excellent descriptions of the landforms, sand bodies, and fossil assemblages in the two papers published in 1936. A combination of these ideas and hypotheses can be seen today at the Nanga Parbat Mountain region where many channeled channels of sand bodies occur today. Furthermore, the author recalls the work of S.R.B. Smith who surveyed the landforms of the Nanga Parbat region for the Geological Survey of India. He collected the information on the nature of the channels, their course, and deposition of the sand bodies. He published his work in 1933. The author further recalls the work of H.C. Jackson who studied the geomorphology and topography of the Paropamisad hill ranges of the Himalaya Mountain ranges during the 1950s. He collected information on the occurrence of landforms and sand bodies with the hypothesis that sand material has been transported to form the landforms. Later he extended the area of his research on the geomorphology of the Paropamisad mountain ranges. Furthermore, the author recalls the work of M.E. Holt who studied the geology of the western Himalaya and described numerous sand bodies in the early 1950s. He 82157476af
